

BENJAMIN OFURHIE

Lisbon, Portugal | +35192005674 | ofurhie@yahoo.com | [Portfolio](#)

PROFILE

Data Professional experienced in building ETL pipelines, cloud data workflows, and analytics systems using Python, SQL, Airflow, PySpark, BigQuery, and AWS. Currently building production-ready data pipelines and responsible for developing production data systems at Dealroom.co, delivering end-to-end data projects encompassing orchestration, warehousing, data quality, and cloud analytics.

TECHNICAL SKILLS

- Programming Languages:** Python, SQL
- Cloud & Platforms:** AWS, Google Cloud Platform, Databricks
- Databases:** PostgreSQL, MySQL, BigQuery, MongoDB
- Tools:** Apache Airflow, PySpark, Apache Kafka, Docker, GitHub Actions
- Data Quality:** Data Validation, Pipeline Monitoring, Error Handling
- Visualization:** Power BI, Looker Studio, Tableau

EDUCATION & CERTIFICATION

- **Google Cloud Certified Professional Data Engineer** — Google Cloud
- **Apache Airflow 3 Fundamentals Certification** — Astronomer
- **Data Engineering Professional Certificate** — IBM
- **AWS Certified Cloud Practitioner** — Amazon Web Services (AWS)

EXPERIENCE

Data Operations Specialist — *Dealroom.co* 2024 – Present | Lisbon, Portugal

- Built Python scraping scripts to extract YouTube video data, automating weekly enrichment for 20–30 new company accounts against main datasets.
- Designed and maintained Python-based ETL processes to extract, clean, and transform API data for team dashboards and KPI reporting.
- Scheduled automated data workflows using GCP Cloud Scheduler, Cloud Functions, and Google Drive API.
- Developed custom automated data checking pipelines to streamline QA workflows and handle automated data quality checks.
- Wrote and optimized SQL queries across large-scale BigQuery tables to support reporting and analytics initiatives.

Data Analyst — *Meri Skill* 2023 – 2023 | Remote

- Designed and automated ETL workflows using Python (Pandas) and SQL to process, clean, and structure large datasets for high-performance analytics.
- Built and maintained data pipelines using Power Query and SQL to standardize data and ensure reliable, timely delivery of recurring business reports.
- Developed Python scripts to automate data ingestion and transformation, reducing manual processing time across operational datasets.

DATA ENGINEERING PROJECTS

YouTube ETL Pipeline [GitHub Repo](#)

- Built an end-to-end ETL pipeline extracting 500+ videos from MrBeast's channel via the YouTube API, utilizing daily incremental loads with deduplication.
- Designed staging and core layers in PostgreSQL, applying custom SQL transformations and relational data modeling best practices.
- Developed Python scripts to automate ingestion, perform schema validation on JSON data, and execute data cleaning.
- Implemented automated data quality checks using Pandas and Python unit tests to ensure pipeline logic, accuracy, and data integrity.
- Containerized the application with Docker and created a GitHub Actions CI/CD workflow to automate testing and deployment.

Uber ETL Pipeline [GitHub Repo](#)

- Designed a scalable ETL pipeline to process approximately 100k rows of Uber ride data, securely loading it into Google Cloud Storage for downstream analytics.
- Orchestrated automated workflows with Apache Airflow using custom DAGs with built-in retry logic and comprehensive error handling.
- Created Python (Pandas) validation pipelines to clean raw ingestion data, enforce null constraints, and standardize schema formats.
- Modeled and structured transformed datasets into BigQuery analytics layers, leveraging optimized tables for enhanced query performance and reporting.
- Containerized the Airflow environment with Docker, ensuring fully reproducible deployment and consistent execution across cloud environments.

Data Warehouse / Modeling Project [GitHub Repo](#)

- Engineered a comprehensive end-to-end data warehouse, integrating data from two source systems (CRM and ERP) into three analytics-ready tables (fact_sales, dim_products, dim_customers) across Bronze, Silver, and Gold layers.
- Designed a star schema model featuring conformed dimensions and fact tables to enhance analytics query performance.
- Developed advanced SQL transformations utilizing CTEs, window functions, joins, and conditional logic for data cleaning and enrichment.
- Implemented robust data quality controls, including duplicate prevention, null validation, and schema checks.

Sales ETL Pipeline [GitHub Repo](#)

- Developed an end-to-end ETL pipeline processing 52,700 sales records using PySpark, orchestrated with Apache Airflow in a fully containerized Docker environment.
- Designed a Parquet-based staging architecture that decouples extract and transform layers, enabling independent re-execution and streaming fault tolerance.
- Applied PySpark transformations including column type casting, converting camelCase to snake_case column names, and populating fields with derived date values.
- Implemented an idempotent UPSERT staging strategy using SQL ON DUPLICATE KEY UPDATE syntax to allow safe pipeline reruns without generating duplicate records.
