

BENJAMIN OFURHIE

Lisbon, Portugal | OfurhieB@yahoo.com | Phone: +35192005674

[LinkedIn](#) | [Portfolio](#)

Junior Data Engineer transitioning from data analytics, with practical experience in Python-based ETL development, SQL data modeling, and cloud workflows on GCP and AWS. Certified in GCP Professional Data Engineering and Apache Airflow.

Technical Skills

- Programming Languages: Python, SQL
- Cloud & Platforms: AWS, Google Cloud Platform, Databricks
- Databases: PostgreSQL, MySQL, BigQuery, MongoDB
- Tools: dbt (Data Build Tool), Apache Airflow, Docker, GitHub Actions (CI/CD), Git
- Data Quality: Data Validation, Pipeline Monitoring, Error Handling
- Visualization: Power BI, Looker Studio, Tableau

Education & Certification

- Google Cloud Certified Professional Data Engineer | Google Cloud
- Apache Airflow 3 Fundamentals Certification | Astronomer
- Data Engineering Professional Certificate | IBM
- AWS Certified Cloud Practitioner | Amazon Web Services (AWS)

Experience

Data Operations Specialist | Dealroom.co

Lisbon, Portugal | 2024 -Present

- Built Python scraping scripts to extract Y Combinator batch data, automating enrichment of 20–30 new companies per run, executed twice weekly against the main database.
- Designed and maintained Python-based ETL processes to extract, clean, and transform API data feeding team-wide dashboards and KPI reporting.
- Scheduled and automated data workflows using GCP Cloud Scheduler to ensure reliable and timely data delivery.
- Developed custom automation tools utilizing OpenClaw to streamline data research workflows and handle automated quality checks.
- Wrote and optimized SQL queries across large-scale BigQuery tables to support reporting and metric definition.

Data Analyst | Meri Skill

Remote | 2022–2023

- Designed and automated ETL workflows using Python (Pandas) and SQL to process, clean, and structure large datasets for operational performance analysis.
- Built and maintained data pipelines using Power Query and SQL to standardize raw data and ensure reliable, timely delivery of recurring business reports.
- Developed Python scripts to automate data ingestion and transformation, reducing manual processing time across operational datasets.

Data Engineering Projects

YouTube ETL Pipeline | Python, PostgreSQL, Docker, Airflow Soda, GitHub Actions [Github Repo](#)

- Built an end-to-end ETL pipeline extracting 986 videos from the MrBeast channel via the YouTube API, with daily incremental loads using unique video IDs as deduplication constraints.
- Designed staging and core layers in PostgreSQL, implementing custom SQL transformations and relational data modeling practices.
- Developed Python scripts to handle automated ingestion, schema validation, flattening of JSON data, and data cleaning.
- Implemented automated data quality checks using Soda alongside Python unit tests to validate pipeline logic and data integrity.
- Containerized the application with Docker and built a GitHub Actions CI/CD workflow to automate testing and production deployment.

Uber ETL Pipeline | Python, Airflow, BigQuery, GCP, Docker [Github Repo](#)

- Designed a scalable ETL pipeline processing ~4.5M rows of Uber ride data, loading securely into Google Cloud Storage for downstream analytics.
- Orchestrated automated daily workflows using Apache Airflow, implementing custom DAGs with retry logic and error handling.
- Developed Python (Pandas) validation routines to clean raw ingestion batches, handle null constraints, and standardize data schemas.
- Modeled and structured transformed datasets into BigQuery analytics layers, creating optimized tables for performance reporting.
- Containerized the entire Airflow environment using Docker, ensuring fully reproducible deployment and execution across cloud environments.

Data Warehouse/Modeling Project | MySQL, SQL Server, Medallion Architecture [Github Repo](#)

- Engineered an end-to-end SQL data warehouse ingesting data from 2 source systems (CRM and ERP), delivering a star schema with 3 analytics-ready tables (fact_sales, dim_products, dim_customers) across Bronze/Silver/Gold layers.
- Designed a star schema model with conformed dimensions and fact tables to optimize analytical query performance..
- Developed complex SQL transformations using CTEs, window functions, joins, and conditional logic for data cleaning and enrichment.
- Implemented data quality controls including deduplication, validation rules, and schema standardization.
- Delivered a BI-ready Gold layer semantic model (fact_sales, dim_products, dim_customers) enabling self-service KPI reporting and scalable analytics across the full Bronze → Silver → Gold pipeline.
